

PROJECT PROPOSAL

Project Title: AgroDrop: Smart Online Marketplace for Agricultural Products

1. Introduction

Agriculture is one of the most important sectors of Bangladesh. However, many farmers face difficulties in selling their products at fair prices due to the involvement of middlemen. At the same time, consumers often struggle to find fresh agricultural products directly from farmers. To solve this problem, **AgroDrop** is proposed as a web-based marketplace that connects farmers and consumers directly. Farmers will be able to sell their agricultural products online, while customers can easily browse, search, and purchase products through a user-friendly platform.

2. Objectives

The main objectives of AgroDrop are:

- To create a digital marketplace for agricultural products.
- To connect farmers directly with consumers.
- To reduce dependency on middlemen.
- To ensure fair pricing for farmers and customers.
- To provide fresh and quality products.
- To develop a user-friendly web application using modern technologies.

3. Technologies Used

Category	Technologies / Tools
Frontend	HTML5, CSS3, Bootstrap 5, JavaScript
Backend	PHP
Database	MySQL
Development Environment	XAMPP Server
Version Control	Git & GitHub

4. System Modules

Farmer Module

- Registration and Login
- Add Products
- Update Products
- Delete Products
- View Product List
- View Customer Orders

Customer Module

- Registration and Login
- Browse Products
- Search Products
- View Product Details
- Place Orders
- View Order History

Admin Module

- Admin Login
- Manage Users
- Approve or Ban Users
- Monitor Products
- View Orders
- Dashboard Statistics

5. Database Design

Below is the structural schema for the proposed database tables:

Users Table	Products Table	Orders Table
• id • name • email • password • role • status	• id • farmer_id • product_name • category • price • quantity • image	• id • customer_id • product_id • quantity • total_price • order_date • status

6. Expected Outcomes

After successful implementation, AgroDrop will:

- Help farmers sell products online efficiently.
- Enable customers to buy fresh agricultural products directly from farmers.
- Increase transparency in agricultural trading.
- Reduce the role of intermediaries.
- Provide a centralized and reliable marketplace for agricultural products.

7. Team Responsibilities

Team Member	Assigned Responsibilities
Member 1	• Frontend Design and Development • Farmer Module Development • Database Design and Configuration
Member 2	• Customer Module Development • Admin Module Development • GitHub Management • Documentation

8. GitHub Workflow

- Daily code commits will be maintained.
- Team members will work on separate modules.
- Changes will be pushed regularly to GitHub.
- Version history will be maintained for collaboration and transparency.

9. Conclusion

AgroDrop is a simple and practical web-based agricultural marketplace that connects farmers and consumers directly. The system will help ensure fair pricing, improve transparency, and provide a convenient platform for buying and selling agricultural products. This project will demonstrate the practical implementation of web technologies, database management, and collaborative software development.
